Vehicle to Person Alert

Reduce the risk of injury to personnel, assets and property from Forklift collisions and near miss occurrences.

Vehicles and pedestrians

Accidents occur frequently between heavy machinery (such as forklifts) and pedestrians because of their heavy loads. The driver's vision can be impaired because of the load, there can be blind spots where the vehicle is operating and the forklift can be carrying loads that could strike a pedestrian worker.

ZoneSafe Vehicle to Person is a Proximity Detection System that detects personnel working in close proximity to forklift trucks, reducing the risk of accidental collisions and serious injuries.

System Overview

The **in-cab control unit** is fitted to the vehicle within reach of the vehicle's operator. An audible visual alarm alerts the driver every time anyone wearing an active RFID tag enters the detection zone. The unit has the capability to store and send data on each ZoneSafe application.

A **detection antenna** is fitted to the vehicle creating a 3-9 metre detection zone around the vehicle. Anyone wearing an active RFID tag will be identified when they enter the detection zone.

An **active RFID tag** is worn by all personnel. The tag can be placed in a hi viz jacket, clipped to a lanyard or simply placed in your pocket.
